

DJPower MULTIPLE VIDEO Overview

MULTIPLE VIDEO PLAYBACK

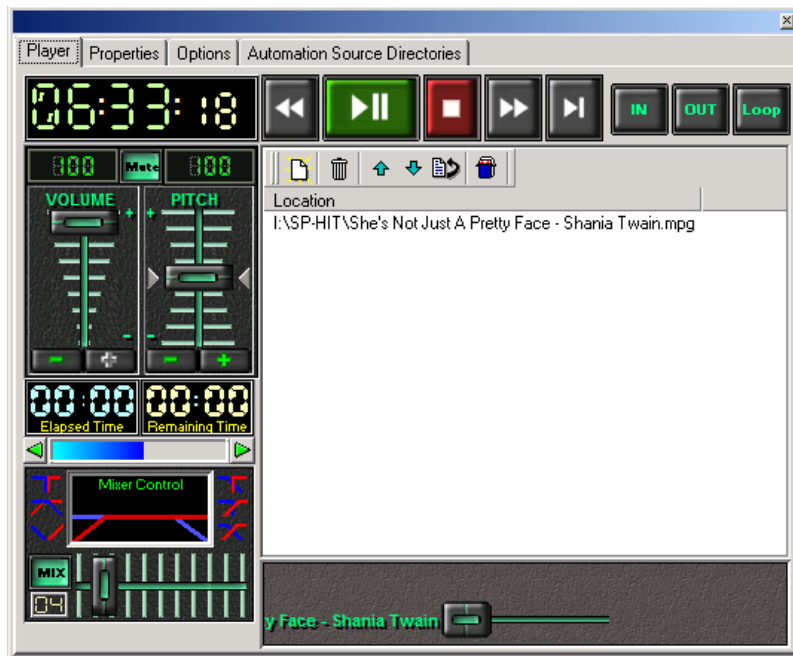

(MPEG Layer I, MPEG Layer II, AVI, MPV, MV1, MV2, DAT)

For club environments, and for DJ/VJs who are running a multiple room party, this is one of the most useful add-ons within DJPower Xtreme. Playing multiple zones of video from one computer system provides an easy, cost effective solution for an entire establishment. In a club environment, multiple rooms can be a standard floor plan which includes dining room, VIP rooms, bar, second floor lounge, outside entrees, restrooms and other individual rooms.

The Multiple Playback Studio provides 24 hours of non-stop video and audio without any interaction with other functions of DJPower. Just turn the zones on and forget about them. Multiple zone playback studios will select the random songs from designated folders and output the audio and video into the programmed zones.

To open the multiple playback studio, click on the Multiple Videos Display button at the bottom of the main DJPower screen. This will open the video playback studio.

Player

Under the “Player” tab, all the buttons should be familiar, as they are the same as on the main DJPower screen and do the same functions. . Therefore we will not go through this tab in detail.

Properties

Click on Properties tab. This will allow you to select the video card, audio card, mixing preference and user defined Mix shape.

Video Playback / Mixing

Click on the down arrow button of the video or audio selection box and select the specific one connected to that room. Also, choose the Mixing Preference for that room.

Video File Extensions

DJPower will read the file extensions during playback that are specified here. Once DJPower realizes it is dealing with a video file, it will display the video on the screen that is specified.

To add an extension, click on “Add”. A “New Video File Extension” window will appear. Type the new extension in the space provided and click on “OK”.
