

DJPower VISUALIZER Overview

Visualization is a powerful tool for VJs and DJs to compliment their gig with ambient video, pictures, or cool computer generated graphics while playing MP3 audio files. If the next song is a music video, it will automatically take over the visualizer, so there is no conflict.

To activate the Visualizer, click on the Visualizer icon, usually located in the lower right-hand corner of the main DJPower screen. However, before doing so, please read the rest of this chapter for important information.

In the case of playing multiple screens simultaneously, the visualizer will give you the opportunity of playing video on one screen while playing ambient video on another screen, plus playing rotating graphics on a third screen. (NOTE: This would require multiple video outputs, as well as additional DJPower software add-ons.)

Visualization Options

DJPower allows for three different and complementary Visualization modes that can be activated using the DJPower Sound Visualizer icon in the main DJPower screen.

1) During playback videos can be played in mute mode as ambient video. To do this, click on “Enable Video Visualization”.

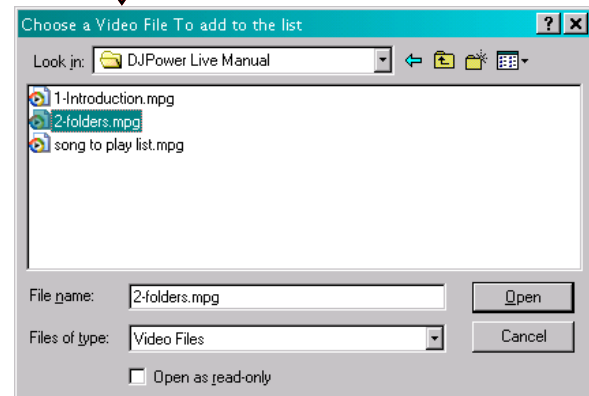

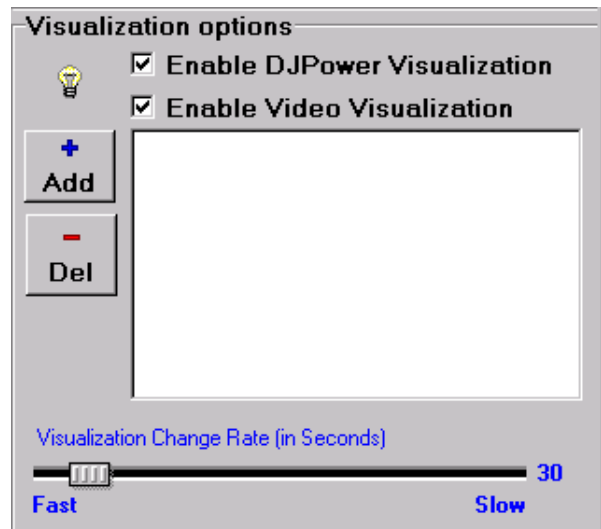

To choose videos to be played, click on the “Add” icon. This will open a “Choose a Video File” window where the drive, folder and file can be chosen. Once the drive, folder and file are chosen, click “Open”. The desired folder will then show in the Visualization window.

2) To alternate between videos and the DJPower Visualizer, check both choices. Alternate in real time by using the DJPower Sound Visualizer icon. If the icon is not clicked, then DJPower will automatically change from video to visualizer based on the change rate (below)

3) Visualize alone can also be chosen.

Visualization Change Rate (in Seconds)

This will determine the length, in seconds, of each video played when Video Visualization is chosen.

Sample Visualizations:
